ABSTRACT

In today’s era of smartphones everybody is connected to the smartphones, there are so many applications on Android smartphones to complete user’s necessary task in daily life as we consider the task of user that he or she has to perform some task on particular location as soon as user will reach at that specific location, normally user forgets these kind of stuff in daily busy life to remember the location and what task he or she has to do. It is very complicated for the user who has to travel through several locations in daily life. In order to solve this problem we developed the system called “Location Based Task Reminder System Using Android Mobile” in this system we are fetching the user’s current location through android mobile phones using Google Map, GPS and allow them to set reminder about that task on that specified location. In this way user can add multiple task reminders at multiple locations this will make effective for the users.

Keywords – Android, Google Map, GPS, Reminder, Smartphones.

I. INTRODUCTION

Nowadays to remember what task to do at what location is very tedious job for everyone because there are so many task that everyone has to perform in their day to day life [6]. Nowadays android smartphones are everywhere and it provides Google Map, Google Location services to the smartphones through which we can easily get the location detail but Google does not provides the facility to add the task reminder on specific location[1][3]. By using their services of Map, GPS and Location we developed the system called as “Location Based Task Reminder System Using Android Mobile”.

This system plays very important role in user’s daily life to set task reminder at several locations through which user can make idea and alert of tasks he has to perform on specific location. There are so many applications on smartphones which provide location based services but they are allow us to set multiple reminder at multiple location through our implemented system we can add multiple reminders on one location. This will help user to improve their daily important activities such as meeting, conference, wedding, party, exam and many more. For marketing and business oriented users it is very beneficial system. We implemented this system using Android Programming language on Android operating system as Android provides more flexibility and ease of installing any application developed on it [5]. We included some permission for fetching the location of the user from Android SDK. “Location Based Task Reminder System Using Android Mobile” focuses on following features.

1) Provides ease of access
2) Quick and easy to handle
3) Provides better reliability
4) Faster access to the location and easily customizable
5) Provide efficient output to the user in terms of reminder of tasks

To meet all these features we used the following tools and techniques in Features Requirement of the System section.

II. FEATURES REQUIREMENTS OF THE SYSTEM

Following are the requirements of our system that we used in implementation of our system.

For feature (1) we used [4], for feature (2) we used [8], for feature (3) we used [4], for feature (4) we used [9], for feature (5) we used [4][8].

We used other requirements to achieve the features of our system.

Software Requirements: Android SDK, JAVA, Android Operating System (Minimum Android 2.3), Eclipse.

Hardware Requirements: 1GB of RAM, 40GB Hard Disk.

III. EXISTING APPROACH

In previous existing approach there was provision to add reminder on a specific location but in that user is able to
add the task reminder on the basis of time and date the problem with system was when user crossed the specified location but he was unable to get the task reminder about the location and if he is on another location then task reminder alert is displayed in this way there was no proper synchronization between task reminder and specified location. There was a provision to add one task reminder at one location only which is quite difficult to the user if he has many other tasks to complete on same place.

There are some following drawbacks of existing system:
1) Less reliability
2) Less location accuracy
3) Only one task reminder on one location
4) No user friendly and customizable
5) Less Ease of access to the application and location

To overcome these drawbacks we proposed the system called “Location Based Task Reminder System Using Android Mobile” which is discussed in the proposed approach.

IV. PROPOSED APPROACH

We proposed the system “Location Based Task Reminder System Using Android Mobile” in which we implemented the services which are overcome and solution on the existing approach. In this system user can able to get his current location even he can browse any of location and add task reminder on that particular location through the Android application. When user will reach the specified location through Android application it will check the task reminder’s specified location and its latitude and longitude if the task reminder’s location is matched with current location of the user the alarm of task reminder will be generated by the Android application. This all activities will be done by using Google map and GPS services.

We used Android programming and operating system for this system which allows easy installation of application. Our proposed system allow user to add many task reminder on the same location and can add multiple task reminder in the application. In our proposed system it doesn’t provide continuous reminder to the user it just simply display the task reminder until and unless the user decline that notification, searching of location from current location is very effective in our system when user will search any location and add task reminder on that searched location it will be stored in the Android smartphones database and if user got the alert from application about task reminder and user decline it or cancel it that will delete from Android smartphones database. It doesn’t collect any used records user can add new location task reminder and if he wants to continue with the same location he can also set same task reminder for same location without cancelling it.

V. IMPLEMENTATION AND WORKING

We used android programming language and Android operating system to implement this system, for connectivity with GPS we used Google API [4]. Google map provides service to Android application for adding task reminder on specific location using “Location Based Task Reminder System Using Android Mobile”.

In given fig.1 there is complete structure of “Location Based Task Reminder System Using Android Mobile”.

When user will connect to the GPS or Wi-Fi an application installed on users Android mobile phone will try to connect to the GPS service. It will fetch location of the user based on users query. There is synchronization with Google Map with our Android application. There is GPS receiver to receive service from GPS and Wi-Fi provides connectivity to the mobile through which user can access any location. Android application allows adding reminder.

In given fig.2 there is flow of “Location Based Task Reminder System Using Android Mobile”.

For adding task reminder user need to install our Android application in their mobile phones. User will ask to certain permission while installing it, once it is accepted by the user the Android application is ready to give service to the user. Following are the permissions we add in implementation.
Fig.2. Flow of “Location Based Task Reminder System Using Android Mobile”.

- Android.permission.ACCESS_FINE_LOCATION
- Android.permission.ACCESS_COARSE_LOCATION
- Android.permission.ACCESS_NETWORK_STATE
- Android.permission.ACCESS_MOCK_LOCATION
- Android.permission.ACCESS_WIFI_STATE
- Android.permission.BIND_INPUT_METHOD
- Android.permission.BIND_DEVICE_ADMIN
- Android.permission.BIND_NFC_SERVICE
- Android.permission.BIND_TEXTSERVICE
- Android.permission.BIND_NFC_SERVICE
- Android.permission.CHANGE_NETWORK_STATE
- Android.permission.ACCESS_WIFI_STATE
- Android.permission.CONTROL_LOCATION_STATUS
- Android.permission.INSTALL_LOCATION_PROVIDER

These permissions we need to add in AndroidManifest.xml file in Android programming development [7]. This will give service based on their work. When user will install the application in their Android mobile phones and when user will open it then it will requires location services provided by the Google. User can browse any of location through the Android application and set task reminder on that specified location when user will reach on that location in the future the service installed in users mobile phone provided by our system will match that latitude and longitude and if that specified task reminder’s locations latitude and longitude matches with the current location after reaching by the user will generate an alert as reminder through the Android application in the user’s Android mobile phones [2]. This system uses the system database to store the Task reminder set by the user. User can view his current location in the view of satellite, Route, Google earth and in navigation form. User can add multiple task reminders on same location. This system is really beneficial to perform daily routine task more effectively. We registered our Google API key to access the services provided by the Google. In such manner our system provides these features and reliability to the user.

VI. EXPERIMENTAL RESULTS

We got the following experimental result after implementing and executing our system.

Below fig.3 is the description of after installing our Android application.

Fig.3. Home Screen of “Location Based Task Reminder System Using Android Mobile”

When user will install our Android application this screen will be shown to user, as per the above figure it needs some input in the form of string as a location. The given figure is the result when user gave some output to the application as shown below.

Fig.4 User input some location for task reminder.
User has to give some location input in the form of string on which location he has to input his task as a reminder. After that it will fetch his current location and destination location in the form of latitude and longitude and matches it from current location to the destination location of the user, which is shown in next result.

Given result is the current location of the user with latitude and longitude.

From above result user can create a note or add the task reminder on the specific location.

In this way user can add a Task Reminder on his required location by simply clicking on CREATE NOTE. User can store his location in the form of latitude and longitude, which is generated by the Android Application.

Given figure is the update of required location distance in the form of latitude and longitude from his current location.

User can view his current location and he can browse also the destination location. User needs to input his required location and just simply press Go to view the location for creating note or adding task reminder on that place.

Below result is the adding of Task reminder on specific location as shown in given experiment.

User can view his required location from his current location in the form of latitude and longitude from which he can guess our location is nearby from current location.

Given fig.8 is the final result of task reminder as shown.
This will be the final result of our system from this user will get the notification along with the vibration until user decline it. If user canceled it, that reminder will be deleted from the system’s database.

VII. CONCLUSION

Nowadays it is the era of Android mobile everywhere, we travelled at so many location in our daily life it is necessary to know at what location what we have to do and what task should we have to perform on that location, generally we forgot which location we are existing and the important work we have to do on that specified location. “Location Based Task Reminder System Using Android Mobile” helps to remind all these kind of activity we have to do on that specific location.it allows user to set location and set reminder on specific location by which he can easily add location of everywhere and add the task on that location through which need not to remind that location and task.it is very useful system through which user can improve their daily work efficiently and effectively without any worries.
